

Personal AI Assistant Business Overview

Business Concept

The core idea is a personal AI assistant that accepts a file, understands the user's task, and executes the task automatically instead of just providing a text answer. It bridges the gap between information comprehension and action execution.

Technical Pipeline

The system processes uploaded files through text extraction, chunking, embeddings, retrieval (RAG), LLM reasoning, action execution, and result delivery. Current implementation supports PDF extraction, chunking, and embeddings; future steps include action execution and LLM reasoning.

Target Customers & Use Cases

Primary targets are small businesses and office professionals who handle repetitive document tasks. Use cases include HR recruitment workflows, accounting report generation, and operations document processing, converting PDFs to Excel, reports, and emails.

Competitive Positioning & Deployment

The product competes on reducing manual steps compared to tools like Claude and ChatGPT. Deployment will start with a mobile app and website, offering a streamlined upload–describe–done workflow, with backend APIs and RAG/Vector Store integration.

Business Model & Marketing Strategy

A freemium model offers limited tasks and files for free, with paid tiers for higher usage, larger files, and additional tools. Marketing focuses on demonstrating time savings through demos, content marketing, LinkedIn outreach, and referrals.
